Information for Moelven customers about EUDR

Traceability, documentation and planned handling of key product flows

In short: Moelven is adapting its traceability systems and trade processes to support EUDR compliance. We will make relevant EUDR information available to customers based on the product, goods flow and agreed solution. Customers must also assess the requirements arising from their own role and from any further use or sale of the product.

What does EUDR mean for you as a Moelven customer?

The EU Deforestation Regulation (EUDR) applies from 30 December 2026; certain micro and small enterprises have a later application date. EUDR applies to products covered by the product codes in Annex I to the Regulation. The information below applies to Moelven products that are covered by EUDR.
The obligations of an actor under EUDR depend on its role in the value chain. The role is determined by the actual transaction, including who imports into the EU, first places the product on the EU market, processes it into a new relevant product, or exports it from the EU. More information is available here: EUDR supply chain infographics

System support:

Moelven and Bergene Holm AS have developed ***TraceWood***, which supports the handling of geolocation, traceability and DDS information throughout the value chain. The solution does not change the obligations of individual actors under EUDR.

Depending on the product, product flow and the customer's role, Moelven can make relevant Due Diligence Statement, origin and traceability information available via API, portal or file.

Planned handling of four common product flows

Product flow	Moelven's handling	Implications for the customer
Sweden → EU	The Swedish Moelven entity handles the obligations arising from its role in the relevant product flow. Moelven retains relevant traceability and reference information.	The product has already been placed on the EU market. The customer assesses its own obligations in connection with resale, processing or other use.
Sweden → Non-EU	Moelven handles the EUDR requirements applicable to the relevant export from the EU.	The customer assesses and complies with the import requirements in the country of destination. If the product is subsequently re-imported into the EU, the importer in the EU must assess which EUDR requirements apply to the relevant product flow.
Norway → EU	As long as EUDR has not been incorporated into the EEA Agreement, Moelven plans a trading model under which the product is placed on the EU market through a Moelven entity in the EU. Moelven handles the EUDR obligations arising from this role.	The customer purchases from and is invoiced by a Moelven entity in the EU. The product has already been placed on the EU market, but the customer must assess its own obligations.
Norway → Non-EU	The main model is direct sales from the Norwegian Moelven entity. Moelven maintains traceability to the origin of the raw material.	The customer assesses and complies with the import requirements in the country of destination. If the product is subsequently imported into the EU, the EU importer must assess its role and obligations under EUDR.
